In vector calculus, the divergence theorem, also known as Gauss's theorem or Ostrogradsky's theorem, is a result that relates the flux of a vector field through a closed surface to the divergence of the field in the volume enclosed.

The divergence theorem tells me this is also equal to the triple integral, d, of div f dV. So, what I got is that the triple integral over d of div F dV equals this derivative. Well, let's think a bit about this derivative so, see, you are integrating function over x, y, and z.
